

Intragen Accelerator for OIM

Your route to a fast deployment of Oracle Identity Manager

When you buy a car, it does all the things a car should do. Whilst some people want cars to have additional features, the basic functionality works from the moment you get the keys. Why should Identity Management be different?

Intragen Accelerator for Oracle Identity Manager transforms Identity Management implementations. Our comprehensive solution helps with the whole project, including analysis, development, testing and deployment, and reduces project duration and cost by up to 60%, eliminating errors associated with normal development processes and greatly improving the overall quality of the solution.

Accelerator Modules for OIM

The five modules work together to enable you to deliver a solution in a fraction of the time

Configuration

Simplify the initial set up and on-going management of your identity deployment

Data Synchronization

Quickly and easily synchronize data between systems

User Lifecycle Management

Deliver sophisticated automated provisioning with minimal effort

Role Modelling

Define roles and generate relevant policies and objects

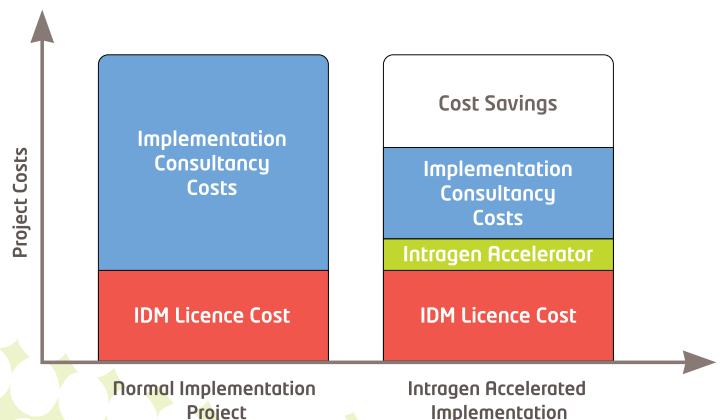

Business Process Workflow

Empower users, retain control and provide auditability with powerful business-process request and approval workflow

IDM Project Implementation Costs

Most customers see cost savings between 30 – 60% on their projects on an on-going basis. Moreover, the accelerator provides an ideal platform to re-engineer and simplify business processes to reduce costs and meet the requirements of today's new software architectures.

Professional Services

In addition to the tool, customers can draw on the experience of Intragen to help them plan and complete their project. Intragen also provides full turn-key project services for those who need to outsource the project. Our track record and ability to understand business as well as technology makes us a valuable partner for your Oracle projects.

Alternatively we can work with trained and certified partners in your locality to deploy the accelerators within your organization.

Intragen offers full field support from our Support Centre. Our staff will assist you with any question or issues in deploying the accelerator.

Accelerator Modules for OIM

Configuration

Simplify the initial set up and on-going management of your identity deployment:

- Configure resources and resource attributes, user's attributes, organizational structure etc.
- Integrated deployment model supports full project life-cycle – development to production
- Ensure consistency between development model and production model
- Easy to generate and deploy new configurations as requirements evolve
- Configuration by exception – the Accelerator “does the right thing” in most cases, meaning you only have to deal with the edge cases

Data Synchronization

Quickly and easily synchronize data between systems:

- Automatic synchronization with no effort in many cases
- Powerful and flexible synchronization model with a choice of implementation languages – Java for compile time checking or scripting languages such as JavaScript for simplicity
- Supports multiple authoritative sources simultaneously (e.g. internal staff, external contractors, partners)
- Automatic validation prevents data errors being synchronized or users being created/updated with invalid data
- Auditing and logging track how synchronization events were handled

User Lifecycle Management

Deliver sophisticated automated provisioning with minimal effort:

- Allows sophisticated user life-cycle business processes to be created by configuration
- Built-in support for many standard joiner-mover-leaver processes and easy to add new ones
- Support for notifications, request/approval workflow and timed events as part of the user life-cycle

Role Modelling

Define roles and generate relevant policies and objects:

- Define logical roles to deliver accounts and entitlements to users
- De-couples logical model from physical implementation
- Abstraction works across resource types (Active Directory, database, SAP, PeopleSoft, etc)

Business Process Workflow

Empower users, retain control and provide auditability with powerful business-process request and approval workflow:

- Model complex request and approval processes using configuration
- Simplify the end-user experience, by allowing them to make ad-hoc requests
- Anything that can be fulfilled (provisioned) can be requested – roles, entitlement, accounts, users
- Flexible approval model – multi-step, multi-user/group/role, sequential or parallel
- Comprehensive logging, auditing and management reporting
- Modular approach allows request, approval and fulfilment (provisioning) to be de-coupled – works well with incumbent technologies to fill part of the gap

Technical Summary

- Fully integrated and compatible with Oracle Identity Manager
- Works with the latest releases including OIM 11G R1
- Full documentation and samples enable developers to quickly deploy OIM

About Intragen

- Intragen was the leading partner in Identity Management for Sun Microsystems for Benelux for 2008 and 2009
- Intragen has continued that success as the Oracle partner of the year 2010 for Commercial Market Technology
- Oracle Platinum Partner and Oracle Global Premier Migration Partner
